

RELATIONS OF THE BASIC FEATURES OF THE SAMPLE WITH THE SUCCESS IN FREE CLIMBING

Abstract

The aim of this paper was to determine relations of the basic features of the sample with the success in free climbing. The research was conducted on 20 male subjects from Serbia, Bulgaria and Rumania competing Naissus route climbing challenge 02 held in 2008 in Jelasnica mountain. On the basis of the obtained results it can be concluded that the basic features of the sample are a good predictor for the success in free climbing. Also, it can be concluded that junior climbers more fit for this season (climbed harder route this season) would be better ranked at the free climbing competition.

Key words: *basic features of the sample, free climbing*
