LATENT DIMENSIONS OF ECONOMIC INDICATORS OBTAINED ON THE STUDENT POPULATION

Abstract
Man has used all his knowledge to make life easier for themselves and made it enjoyable. Primarily teamed with others and formed a community (family), interest groups (tribes and genera) and then society as abstract entities (nations). Moreover, in accordance with the time, he set up the whole scientific fields such as medicine, sociology, psychology, kinesiology, etc., to deal with himself or egg economy, so that it has resources around them in order to "better life". As then, so today, we could say that it was an important link of economic development to increase the living standards of people and their overall position in society. In addition, as can be seen, the entire present-day international economic system and relations are encouraging all activities of the ownership and the establishment of political relations to the development of different economies. In this sense, the article elaborates underlying latent economic data obtained from a broader population of students from linguistically less problematic areas of southern Europe.

Key Words: economic indicators, latent dimensions, students
